

## ABSTRACT

A door hook including a U-shaped bracket having a top member and front and back sides attached to the top member. The front and back sides are separated by a first distance, which corresponds generally to the thickness of a door over which the door hook is to be placed. A J-hook is attached to the front side, while a spacing member is attached to the back side or top. A hinge element is formed in the back side or top such that the spacing member is pivotable toward a position under the top member. With the spacing member in this position, the spacing member and the front side are separated by a second distance, less than the first distance, which corresponds generally to the thickness of a thinner, second door over which the door hook may be placed. In this manner, the door hook may be easily adjusted to fit over doors having different thickness, such as, for example, exterior and interior doors.
